Expected Result:				

Description

When the user deletes a mapped item from the intersection table, the entire row of the item should be deleted from the intersection table,
instead of changing the value linked to Null as this causes side-effects with the linked provider to the mapped item

Steps to duplicate:
1- Go to 00000 00000 screen and make sure there is a defined item with mapped items linked to it
2- Go to 000000000 00000 screen and link a provider to the mapped item from step 1
3- Go back to 00000 00000 and delete the mapped item (separate it from the defined item)
4- check that the item has been removed from the intersection table related to the defined item, and the intersection table related to providers

Expected:
the item should be removed from both tables and un-linked from both defined item and providers

Actual:
the item still exists in the intersection table related to providers and can be linked again to the same provider

Covered in SRS
9.5.4 Task screens and fields

Tested and verified that un-linking the mapped item from the defined item deletes it from the provider as well.
